

PROGRAM

```
import java.io.*;

public class FileReadWriteExample {

    public static void main(String[] args) {

        String inputFilePath = "input.txt";

        String outputFilePath = "output.txt";

        try (

            BufferedReader bufferedReader = new BufferedReader(new FileReader(inputFilePath));

            BufferedWriter bufferedWriter = new BufferedWriter(new FileWriter(outputFilePath))

        ) {

            String line;

            while ((line = bufferedReader.readLine()) != null) {

                bufferedWriter.write(line);

                bufferedWriter.newLine(); // Write a new line after each line read

            }

            System.out.println("File read and written successfully.");

        } catch (FileNotFoundException e) {

            System.out.println("Error: File not found: " + e.getMessage());

        } catch (IOException e) {

            System.out.println("I/O error: " + e.getMessage());

        } catch (SecurityException e) {

            System.out.println("Security error: " + e.getMessage());

        } catch (Exception e) {

            System.out.println("An unexpected error occurred: " + e.getMessage());

        } } }
```

OUTPUT

[Running] `cd "c:\Users\HP\Desktop\LAB\" && javac FileReadWriteExample.java && java FileReadWriteExample`
File read and written successfully.

[Done] exited with code=0 in 0.889 seconds

ALGORITHM

1. While reading lines from the input file:
2. Read a line using `bufferedReader.readLine()`.
3. If the line is not null:
 - Write the line to the output file using `bufferedWriter.write()`.
 - Write a new line using `bufferedWriter.newLine()`.
4. If the line is null, exit the loop (end of file).
5. If a `FileNotFoundException` occurs:
 - Print "Error: File not found: " + `e.getMessage()`.
6. If an `IOException` occurs:
 - Print "I/O error: " + `e.getMessage()`.
7. If a `SecurityException` occurs:
 - Print "Security error: " + `e.getMessage()`.
8. If any other Exception occurs:
 - Print "An unexpected error occurred: " + `e.getMessage()`
9. After successfully reading and writing, print "File read and written successfully."
